

Identity Theft

What You Need To Know

An exclusive seminar revealing the state-of-the-art technologies and techniques being used today by federal agencies and corporations to ensure that your customers – as well as your employees – will not become victims of identity theft.

How Safe Is **YOUR** Information?

Personal identities are being stolen at alarming rates, creating havoc for innocent victims. “Phishing” collects computer information without permission, worms and viruses can invade computers and steal sensitive records and computer systems may be left vulnerable to illegal hackers. Your customers trust their confidential personal data to you, but what are you doing to protect that trust?

On October 18 our panel of experts will reveal the newest high tech weapons being used to combat the crime of the 21st century. At this seminar you will learn what you can do to protect information for your company, clients and employees. This important seminar is a must for financial executives, security directors and facility and property managers.
